

myCopernic™

Search, Access, Connect. From Anywhere.

## The central point of access to all the data that matters to you.

myCopernic provides solutions that answer to your needs in terms of data search and accessibility. It offers a single point of access to multiple search solutions through a secure Web portal, making it available from virtually anywhere.

- The only account you'll need for all your search and data access needs
- Easy administrator interface lets you control the type and number of services that users can access
- A central Message Center notifies you of news and system alerts from all your services
- Expand your hive by adding functionality with new services as they emerge

### How it Works

The client computer contains hundreds of documents, emails and media files. myCopernic uses the power of personal desktop searching to enable users to access their searchable content from anywhere.

The connector, a software application installed on the client computer, seamlessly connects to the myCopernic network to securely and privately make data searchable from virtually any remote device equipped with a web browser.

### Security

Three levels of security are used for myCopernic:

1. Your account is protected by a password that you are the only one to know. Accessing your data requires this password.
2. myCopernic is hosted on an HTTPS site to ensure that all your activity is protected against eavesdropping.
3. Communications between the myCopernic connector installed on your computer and our servers are encrypted using an SSH protocol.

#### myCopernic Requirements

- A supported Desktop Search application
  - Copernic Desktop Search 3.0 or higher
  - Windows Desktop Search
- myCopernic connector
- A subscription to one or more of the myCopernic services

#### myCopernic Connector Requirements

- A computer with broadband access
- Microsoft Windows XP SP2 or higher (32-bits)
